

Insulation

Unnecessary heating in winter and cooling in summer costs a lot of money. To overcome this, more effective insulation should be installed.

The effectiveness of an insulator is measured by its R value. The higher the R value the more effective the insulator.

The diagram below shows the corresponding areas to the table on the next page, which recommends the suitable R values for homes in Victoria.

RULE OF THUMB

Always remember that insulation must be installed correctly in order to reduce the flow of heat energy in and out of the building.
